

Radial piston motor for track drives

MCR-T

RE 15221

Edition: 03.2017

Replaces 07.2015

- ▶ Frame size MCR5, MCR6, MCR10
- ▶ Displacement 620cc to 1340cc
- ▶ Differential pressure up to 400 bar
- ▶ Torque output up to 8530 Nm
- ▶ Speed up to 250 rpm
- ▶ Open and closed circuits

Features

- ▶ Compact robust construction
- ▶ High brake capacity
- ▶ High volumetric and mechanical efficiencies
- ▶ High pressure rating
- ▶ High reliability
- ▶ High bearing life
- ▶ Low maintenance
- ▶ Smooth running at very low speeds
- ▶ Low noise
- ▶ Freewheeling possible
- ▶ Available with
 - Integrated parking brake
 - Bi-directional two speed
 - Integrated flushing valve
 - Speed sensor

Functional description

Hydraulic motors of the type MCR-T are radial piston motors with front case mounting and flanged shaft. They are specially designed for track drive applications and are primarily used as drive motors on skid-steer loaders and compact track loaders.

The MCR-T type motor can be used in open as well as closed hydraulic circuits.

Construction

Two part housing (1, 2), rotary group (3, 4, 8), cam (5), drive shaft (6) and flow distributor (7)

Transmission

The cylinder block (4) is connected to the shaft (6) by means of splines. The pistons (3) are arranged radially in the cylinder block (4) and make contact with the cam (5) via rollers (8).

Torque generation

The number of working and return strokes corresponds to the number of lobes on the cam multiplied by number of pistons in the cylinder block.

Flow paths

The ports **A** and **B**, which are located in the rear case, carry oil through the distributor to the cylinder chambers (**E**).

Bearings

Tapered roller bearings capable of transmitting high axial and radial forces are fitted as standard.

Freewheeling

In certain applications there may be a requirement to freewheel the motor. This may be achieved by connecting ports **A** and **B** to zero pressure and simultaneously applying a pressure of 2 bar to the housing through port **L**. In this condition, the pistons are forced into the cylinder block which forces the rollers to loose contact with the cam thus allowing free rotation of the shaft.

Two speed operation (2W)

In mobile applications where vehicles are required to operate at high speed with low motor loads, the motor can be switched to a low-torque and high-speed mode. This is achieved by operating an integrated valve which directs hydraulic fluid to only one half of the motor while continuously re-circulating the fluid in the other half. This “reduced displacement” mode reduces the flow required for a given speed and gives the potential for cost and efficiency improvements. Maximum rated speed of the motor remains unchanged.

Bosch Rexroth has developed a special spool valve to allow smooth switching to reduced displacement whilst on the move. This is known as “soft-shift” and is a standard feature of 2W motors. The spool valve requires either an additional sequence valve or electro-proportional control to operate in “soft-shift” mode. Alternatively, enhanced soft-shifting via software control primarily for Compact Track Loader applications is now available from Bosch Rexroth.

▼ Two-speed motor

Note

2W can not be used in open circuit.

Flushing valve

In a closed circuit, the same hydraulic fluid continuously flows between the pump and the motor. This could therefore lead to overheating of the hydraulic fluid.

The function of the flushing valve option is to replace hydraulic fluid in the closed circuit with that from the reservoir. When the hydraulic motor is operated under load, either in the clockwise or counter-clockwise direction, the flushing valve opens and allows a fixed flow of fluid through an orifice from the low pressure side of the circuit. This flow is then fed to the motor housing and back to the reservoir normally via a cooler. In order to charge the low pressure side of the circuit, cold fluid is drawn from the reservoir by the boost pump and is fed to the pump inlet through the check valve. Thus the flushing valve ensures a continuous renewal and cooling of the hydraulic fluid. The flushing feature incorporates a relief valve which is used to maintain a minimum boost pressure and operates at a standard setting of 14 bar (other options available on request). Different orifice sizes may be used to select varying flows of flushing fluid. The following table gives flushing rate values based on a boost / charge pressure of 25 bar.

▼ Motor with flushing valve

Flushing flow rates

Flushing code	Orifice size (mm)	Flow (l/min) at 25 bar ¹⁾	
		min	max
F1	ø1	2.2	2.7
F2	ø1.5	5.0	6.1
F7	ø1.7	6.4	7.8
F4	ø2	8.2	10.7
F6	ø2.3	8.8	11.4

1) 0.6 mm Shim (Standard), Cracking pressure = 11±3 bar

Holding brake (multi-disc brake)

Mounting

The MCR T-type motor has a spring applied pressure released holding brake integrated into the front of the motor.

Brake application

As a safety requirement in mobile applications a parking brake is provided to ensure that the motor cannot turn when the machine is not in use. The parking brake provides holding torque by means of discs that are compressed by a disc spring. The brake is released when oil pressure is applied to brake port "Z" and the pressure in the annular area compresses the disc spring allowing the brake discs to turn independently.

Notice

Brakes not for dynamic use!

▼ Schematic diagrams

Speed sensor

A Hall-effect speed sensor (**16**) may be fitted as an option, giving a two-channel output of phase-displaced square waves, and enabling detection of speed and direction. A toothed target disc (**17**) is fitted to the motor cylinder block (**4**), and the sensor, fitted to a port in the rear case, produces a pulse on each channel as each tooth passes in front of it. The frequency of the pulses is proportional to the rotational speed.

Versions are available for use with regulated supplies 10 V (Code P1) and for direct connection to a 12 V or 24 V unregulated supply (Code P2).

The motor can also be supplied fitted with a target disc and with a speed sensor port machined, but covered and sealed with a blanking plate (Code P0). These “sensor-ready” motors may be fitted with a sensor at a later date.

Notice

- ▶ Motor performance values all based on theoretical calculations.
 - ▶ Efficiencies not taken into consideration for theoretical calculations.
 - ▶ Brake torque accounts for tolerances.
- Please refer the related foot notes for more details.

Footer from page 8 and 9

- 1) Ensure motor case is filled with oil prior to start-up.
- 2) For installation and maintenance details, please see operating manual 15215-B.
- 3) Other displacements and ratios contact Bosch Rexroth.
- 4) For any other fluid type contact the Engineering Department at Bosch Rexroth, Glenrothes. For more information on hydraulic fluids, see datasheets 90220 and 90223.
- 5) Extension of the allowable temperature range may be possible depending on specification. Please consult Bosch Rexroth Engineering Department in Glenrothes for further Details.
- 6) Maximum values should only be applied for a small portion of the duty cycle. Please consult Bosch Rexroth Engineering Department in Glenrothes for motor life calculations based on particular operating cases.

- 7) When operating motors in series, please consult Bosch Rexroth Engineering Department in Glenrothes.
- 8) For continuous operation at speeds <5 rpm please consult Bosch Rexroth Engineering Department in Glenrothes.
- 9) Based on nominal no-load Δp of 20 bar in full- displacement mode.
- 10) Warning! During the running in period of the motor (min. 20 hrs) it should not be run unloaded at >100 rpm.
- 11) Guide values for up to 5000 hours of motor operation (ISO VG46 and 50°).
- 12) Low displacement = 450 bar, high displacement = 400 bar
- 13) At 0 bar case pressure, the quoted brake release pressure is over and above any case pressure present.
